

ABSTRACT OF THE DISCLOSURE

1
1 The present invention pertains to a system and method of analyzing gene expression,
2 gene annotation, and sample information in a relational format supporting efficient exploration
3 and analysis, comprising: providing a data warehouse which comprises a gene expression
4 database for storing quantitative gene expression measurements for tissues and cell lines
5 screened using various assays; a clinical database for storing information on bio-samples and
6 donors; and a fragment index for biological properties for DNA fragments; receiving a query
7 regarding gene expression of one or more DNA fragments; determining the level of gene
8 expression of the one or more DNA fragments; correlating the level of gene expression with the
9 clinical database and the fragment index; and displaying the results of said correlation.
